

MATTHEW PAVER

AI Solutions Architect

London, UK · mattpaver@outlook.com · +44 7771 672205 · [LinkedIn](#) · [GitHub](#) · matthewpaver.github.io

PROFILE

Solutions architect with seven years in data and AI. I design and build AI systems that people use in their daily work, and I stay with them until they're working. At Trustpilot, through Ciklum, I've put AI tools live for Legal, HR and Communications, including one that is high-risk under the EU AI Act. Before that, I built forecasting tools for Rolls-Royce, Baker Hughes and HS2.

EXPERIENCE

Automation & AI Consultant | Ciklum · placed at Trustpilot

Nov 2025 – Present

Lead AI and automation projects for Trustpilot's Digital Business Partnering team, from discovery to support after launch.

Litigation Tracker and Press Office triage · AI email triage

Both live

Legal updated its case tracker by hand from correspondence in several languages, where one wrong detail is costly. The press office read every incoming email to find the few genuine journalist enquiries.

- Mapped how Legal and the press office handled email, then built two assistants that read it, extract the key details and draft the next step. A person approves every output before anything is sent.
- Required every extracted legal detail to cite its source, with a lawyer approving each entry. Within three months of launch, corrections fell by over 80% and manual edits to the old tracker by around 90%.
- Verified each journalist against a list of real outlets and routed crisis enquiries straight to people. Scored the classifier weekly against a fixed test set, and it stayed above target through go-live.

Tech Google Cloud Functions (EU-hosted) · LLM extraction with citations · weekly evaluation set · retry and quarantine queues · metadata-only logging

Claude adoption measurement · evidence for a company-wide AI rollout

Live

Leaders rolling Claude out across the company needed to know who was using it regularly and which seats sat idle.

- Agreed with the programme leads what each checkpoint had to answer, then built and own the live adoption dashboard. It pulls daily from Anthropic's admin and analytics APIs, joins survey and workshop data, and rolls small teams up so no individual is exposed.
- Set the measurement rules: regular use measured per seat over the time it was licensed, idle seats counted as lost value, and no ROI figure from small survey samples. This traced a dip in regular use to new joiners.
- During the rollout, Cowork (Anthropic's agentic desktop app) grew from about a third to over half of weekly use. Among people who took the Claude course I wrote, regular use rose about twice as much as among those who didn't, in an observational comparison.

Tech Python Cloud Functions · Anthropic Admin and Analytics APIs · Google Drive · daily scheduled refresh · CI

Automation platform, governance and benefits tracking · a governed route from request to release

Several departments wanted automation at once. If each built its own scripts, every one would need separate access and support, and nobody would know which touched personal data.

- Gathered each department's requests and risks, then built a shared n8n platform on AWS from scratch, with a sandbox per department and five checks between request and release.
- Wrote the company's AI policies and run the intake, so Security and Privacy review every AI idea before anyone builds it.
- Rebuilt the team's delivery and value report on the ROI Institute's five-level method and APM benefits practice. It separates adoption, business impact and financial return, counts full team cost, and shows no portfolio ROI until business owners sign off each claim against real volumes.

Tech n8n on AWS · EU AI Act · ISO 42001 · NIST AI RMF

Leadership feedback platform · 360° feedback with AI-written reports

Live

Leaders wanted honest feedback, and colleagues only give it if they can't be identified. Because it assesses named employees, the tool is high-risk under the EU AI Act and needed legal and privacy sign-off before launch.

- Worked through the process and privacy requirements with People and Legal, then built and launched it in English, Danish and Dutch. Colleagues rate a leader and Gemini drafts the summary report. The first company-wide cycle is complete.
- Ran the data protection impact assessment and secured DPO sign-off before launch. A minimum number of raters per report stops any comment being traced back.
- Run it in production. When one group stopped receiving invitations, traced the fault to the scheduler, fixed it and checked every affected person.

Reward Cycle Platform · pay and promotion decisions in one system

In testing

Promotions, salary review, bonus and share plans ran on spreadsheets whose rules contradicted each other. A mistake means someone is paid the wrong amount.

- Technical owner and design author. Mapped the cycle with HR business partners, then split open questions into policy for HR to decide and engineering for the team, so no rule is automated before it is agreed.
- Designed one application with rule-based calculations, the approval chain the business uses, delegation, budget limits and a full audit trail. In internal testing on synthetic data ahead of a feasibility decision.
- Kept AI out by design: people make pay decisions, and leaving AI out avoids a high-risk classification. Success will be measured by exceptions, overrides and rework against the spreadsheet cycle.

Tech versioned rule configuration · Sage HR data contract · staged approvals with delegation · SSO

Solutions Architect | Projecting Success

Jul 2025 – Oct 2025

- Designed Project Brain, a knowledge graph linking project risks, actions and documents so teams can spot related risks across projects, and helped build Marvin, an assistant that answers questions over it.
- As Data Protection Officer, led the company through Cyber Essentials and Cyber Essentials Plus.

Tech Neo4j · GraphRAG · LangChain · Pinecone

Data Scientist | Projecting Success

Jun 2022 – Jul 2025

- On multi-million-pound programmes for Rolls-Royce, Baker Hughes and HS2, change boards learned about slipping milestones too late. Built forecasting models that flag them early, tested against simple baselines and shown as ranges so boards could judge how far to trust each flag.
- Delivered prototypes for Rolls-Royce and Baker Hughes, a self-serve risk tool, and the Power BI dashboards delivery leads used to raise risks before the board met.

Tech Python · Databricks · ARIMA/SARIMA · change-point detection · rolling-origin backtesting · Flask · Power BI

Data Analyst | Projecting Success

Sep 2019 – Jun 2022

- Automated KPI and risk reporting with Power BI and Python, cutting manual reporting time by 70%.
- Trained 200+ apprentices in data literacy across defence, engineering and utilities.

PERSONAL PROJECTS

PolicyLens: shows whether an AWS access-policy change opens a new path to a sensitive action. A rules engine decides and cites the policy line, and the LLM explanation appears only when it passes a grounding check. Every change is checked automatically against 55 edge cases written from AWS's own rules. github.com/MatthewPaver/iam-policy-auditor

ProjectLens: boards often approve change packs on the narrative alone. It checks a pack against the Primavera schedule, flags contradictions and records the human decision, all in the browser. Tested on synthetic packs. matthewpaver.github.io/ProjectLens

SKILLS

Architecture and value	solution and target architecture · discovery and process mapping · options and build-versus-buy · business cases · benefits baselines and owners · ROI evaluation (ROI Institute five levels) · RFCs · UAT and phased rollout
Responsible AI	EU AI Act classification · data protection impact assessments (GDPR Art. 35) · ISO 42001 · NIST AI RMF · AI policy and intake · Data Protection Officer
AI engineering	LLM applications · RAG and GraphRAG · structured output · LangChain · MCP · vector search · evaluation and adversarial testing · guardrails · human-in-the-loop design
ML and data	forecasting (ARIMA, SARIMA) · XGBoost · change-point detection · Python · SQL · pandas · scikit-learn · PySpark · DuckDB · PostgreSQL · Neo4j/Cypher · Power BI
Cloud and build	Google Cloud (Vertex AI, Cloud Functions, Firebase) · AWS (Bedrock, Lambda, DynamoDB, S3) · n8n · Terraform · TypeScript · React · Next.js · FastAPI · Docker · GitHub Actions

EDUCATION AND CERTIFICATIONS

BSc (Hons) Computer Science with Artificial Intelligence

University of Liverpool

Level 4 Project Data Analyst Apprenticeship

Projecting Success

Certifications AWS Certified AI Practitioner (2026) · AWS Certified Cloud Practitioner (2026) · Hugging Face AI Agents (2025) · Neo4j Certified Professional · UiPath RPA Developer Advanced · BCS Data Analysis
